

# The FitFlow Hooks

What the app writes into GoHighLevel, and how to build automation on it.

## What's already done vs. what's yours

| BUILT INTO THE APP <span>DONE</span>                                                | YOURS TO BUILD IN GHL <span>TO DO</span>       |
|-------------------------------------------------------------------------------------|------------------------------------------------|
| Writes 4 tags to the contact record on every marked appointment.                    | The workflows that <i>react</i> to those tags. |
| Clears tags that no longer apply, so each contact carries one current state.        | Deciding what each automation actually sends.  |
| Sets appointment status, moves pipeline stage, sets won/lost, writes an audit note. | Nothing — that side is complete.               |

### NOTHING EXISTS IN YOUR GHL ACCOUNT YET

The app is the **emitter**. It puts tags on contacts. Zero workflows, triggers or automations have been created in GoHighLevel — I have no access to your account and couldn't create them. Until you build the listener side, the tags simply sit there as searchable labels.

## The four tags

| TAG                    | APPLIED WHEN                    | MEANS                                                |
|------------------------|---------------------------------|------------------------------------------------------|
| fitflow-attended       | Booked <i>or</i> Not Continuing | They turned up. Present for both attending outcomes. |
| fitflow-booked-next    | <span>Booked</span>             | Turned up <i>and</i> committed to the next step.     |
| fitflow-no-show        | <span>No Show</span>            | Didn't turn up. Recoverable.                         |
| fitflow-not-continuing | <span>Not Continuing</span>     | Turned up, declined to proceed.                      |

### TAGS ARE CURRENT STATE, NOT HISTORY

Marking a new outcome **removes** the tags that no longer apply. A contact who no-shows in March then attends and rebooks in April ends with only `fitflow-attended` + `fitflow-booked-next` — the no-show tag is gone. Without this, a "sorry we missed you" workflow would keep firing at someone who has already enrolled. History lives in the Audit tab and the GHL appointment notes.

## Building a workflow — the pattern

In GoHighLevel: **Automation** → **Workflows** → **Create Workflow** → **Start from Scratch**. Then:

1. Add Trigger → **Contact Tag**
2. Set the condition to **Tag Added** (not "has tag" — you want the moment it changes)
3. Pick the tag, e.g. `fitflow-no-show`
4. Add your actions — email, SMS, task, opportunity update, internal notification
5. **Publish**. A saved-but-unpublished workflow never fires.

### USE "TAG ADDED", NOT "CONTACT HAS TAG"

"Has tag" is a standing condition and can re-evaluate. "Tag Added" fires once, at the moment of the change — which is what you want, since the app sets these tags exactly once per marked appointment.

## Three workflows worth building first

1 · No-show recovery highest value

**Trigger** Tag Added → `fitflow-no-show`  
**Then** Wait 15 min → SMS "Sorry we missed you, grab a new time: [booking link]"  
**Then** Wait 1 day → Email with the same link → create a task for the rep  
**Why** No-shows are recoverable, and speed matters more than polish. This is where the money is.

## 2 · Objection follow-up

**Trigger** Tag Added → `fitflow-not-continuing`  
**Then** Wait 3 days → Email: case study / social proof  
**Then** Wait 30 days → move to a long-term nurture campaign  
**Why** The app already marks the opportunity `lost`, so these people leave your active pipeline. This keeps them reachable without polluting your numbers.

## 3 · Booked confirmation

**Trigger** Tag Added → `fitflow-booked-next`  
**Then** Send prep material for the next appointment  
**Then** Notify the assigned rep internally  
**Why** Momentum. The gap between booking and the next session is where people go cold.

## Timing — read this before you build

Tags are **not** written the instant a rep clicks. Marking an outcome queues the write; the queue drains at **local midnight** (or when you press *Sync now*). So a no-show marked at 10am triggers its workflow at midnight, roughly 14 hours later.

That delay is deliberate — it's what lets a rep correct a mis-click without a wrong automation having already gone out. But it shapes what you should build:

| WORKS WELL WITH THE DELAY         | DOESN'T                                        |
|-----------------------------------|------------------------------------------------|
| Next-day recovery sequences       | "We missed you" sent 15 minutes after the slot |
| Multi-day nurture                 | Anything time-critical on the same day         |
| Task creation for tomorrow's list | Live rep notification during the call block    |

If you want same-day triggering, press **Sync now** on the Today view after each call block — or tell me and I'll add an option to sync immediately on marking instead of queueing.

### TEST BEFORE YOU TRUST IT

Build one workflow. Set its only action to an internal notification to yourself. Mark one real appointment, press Sync now, confirm the tag lands on the contact and the workflow fires. Then add the real actions. Do not point live client messaging at an untested trigger.

## Other things you can trigger on

The tags are the cleanest hook, but the app writes four other signals GHL can act on:

| SIGNAL                                                         | GHL TRIGGER TO USE                                                              |
|----------------------------------------------------------------|---------------------------------------------------------------------------------|
| Appointment status → <code>showed</code> / <code>noshow</code> | Appointment Status trigger — fires without any tag involved                     |
| Pipeline stage moved                                           | Opportunity Stage Changed                                                       |
| Opportunity marked won / lost                                  | Opportunity Status Changed                                                      |
| Note added to appointment                                      | Rarely useful as a trigger, but it's your human-readable audit trail inside GHL |

Tags are usually the better choice because they carry FitFlow's richer vocabulary — GHF's `showed` can't tell you whether the next step was booked, but `fitflow-booked-next` can.
