

## v2 — The Marketing Intelligence Plan

From a hands-on attendance tool to an observe-and-analyze dashboard that shows the CEO where money works, where people are lost, and what each customer costs.

### The shift

FitFlow stops being something a rep operates and becomes something the CEO reads. It pulls from GoHighLevel, Meta Ads and Google Ads, reorganizes the numbers into clear stats and diagrams, and uses the Anthropic API to turn them into plain recommendations — *"spend more here, less there."* Everything already built stays as the data foundation.

| LAYER                                     | WHAT IT ANSWERS                                                                                                                                           |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 • Marketing intelligence (top priority) | Weekly customer acquisition cost, conversion rates step-to-step, which ads/campaigns work, where people drop out of onboarding — plus AI recommendations. |
| 2 • Everything in one place               | Counts at each onboarding stage, number of calls, pipeline value — at a glance.                                                                           |
| 3 • The existing tools                    | Marking, audit, day summary — kept, but demoted from the front door.                                                                                      |

### What your four answers locked in

| QUESTION              | YOUR ANSWER            | WHAT IT MEANS FOR THE BUILD                                                                                                                                                                                                        |
|-----------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ad → lead attribution | Unknown — investigate  | Channel-level analysis always works. During build I pull a real contact, see exactly what ad data GHL stores, and light up per-campaign / per-ad detail only where the data supports it — with a "coverage %" so nothing is faked. |
| Extra sources         | Google Ads             | Meta first (paste-a-token). Google Ads API is heavier — phased last, with a CSV upload so Google spend is never a blocker.                                                                                                         |
| Marking feature       | Keep as optional input | Today view stays but is demoted. The dashboard becomes home.                                                                                                                                                                       |
| AI delivery           | Both                   | An on-demand "Analyze" button and an automatic weekly report.                                                                                                                                                                      |

### Three things to be clear-eyed about

#### THESE ARE REAL LIMITS, NOT BLOCKERS — THE PLAN HANDLES EACH HONESTLY

**No real cash revenue.** You didn't add Stripe, so CAC (spend ÷ new customers) is solid, but "revenue/ROAS" uses GoHighLevel's *estimated* deal value — labelled as estimated, not banked cash.

**Per-ad ROI depends on attribution.** If your leads carry campaign/ad tags, you get "Ad #3 is your winner." If they only carry "Facebook," you get channel-level truth instead — shown clearly, never guessed.

**Google Ads is the hard one.** Its API needs a developer token and OAuth, not a paste-a-key. It's phased last; CSV covers it until then.

## How it's built

---

### New data it will hold

- **Ad spend** — daily spend, impressions, clicks and leads per campaign / ad set / ad, from Meta (and Google/CSV).
- **Full attribution on each lead** — the campaign, ad and click IDs GoHighLevel stores, captured on import (currently thrown away).
- **Analysis history** — every AI report saved with the exact numbers it analysed, so you can scroll back.

### The engine (the real value)

A join layer connects **ad spend** → **lead** → **outcome** on the best key available, computing weekly CAC, cost-per-booked-call, cost-per-enrolled, step-to-step conversion, and biggest-drop-off detection. Then the Anthropic layer packages that snapshot and returns structured recommendations grounded only in your real numbers.

### The screen

The home page becomes a **Command Center**: a KPI row (weekly CAC, consult → enrolled conversion, new customers, biggest drop-off), a spend-vs-acquisition chart by channel and campaign, an onboarding funnel with the leak highlighted, and an AI recommendations panel. It reuses the entire existing design system — no visual rework.

## The plan, in four shippable phases

---

### Phase A — Foundation

NO NEW LOGINS NEEDED

Command Center as home; demote Today; capture the attribution GHL already has; onboarding funnel with drop-off; weekly blended CAC. Delivers "everything in one place" and "where we lose people" right away.

### Phase B — Meta ad spend + the join

THE CORE ASK

Pull Meta spend, join it to leads and outcomes, show spend-vs-acquisition and per-campaign cost and return. This is "which ads work."

### Phase C — AI recommendations

THE CEO'S HEADLINE

On-demand Analyze button plus an automatic weekly report with saved history — practical "spend more/less here" guidance.

### Phase D — Google Ads

LAST

CSV upload first; native Google Ads API once you provide developer-token / OAuth access.

### WHY THIS ORDER

Phase A needs nothing new from you and immediately answers "where are we losing people" — the CEO's second-biggest ask — using data already in GoHighLevel. Each later phase adds one source and is useful on its own, so you see value continuously rather than waiting for a big-bang launch.

---

Nothing here is built yet — this is the plan for your sign-off. On approval I start with Phase A. Credentials for Meta, Google and Anthropic are entered in-app, verified on save, and masked — exactly like the GoHighLevel token today.
