

v2 Master Plan — The Growth Intelligence Layer

Rebuilt around the Aug 19 call: a read-only dashboard over GoHighLevel + Meta + Google + Stripe, with automated emails and AI analysis. Miranda's pipeline stays untouched.

What the call changed

DECISION FROM THE TRANSCRIPT	CONSEQUENCE
Read-only. "Nothing touched in GoHighLevel — it just reads." Miranda's pipeline is the source of truth.	The marking tool, tags and write-back engine come out of the UI (code kept dormant). An entire class of bugs — corrupting Miranda's pipeline — becomes structurally impossible.
Mirror Miranda's actual buckets , whatever they are, even when they change.	Stages are read live from GHL each sync, not hardcoded. New/renamed stages surface for one-click mapping with a Claude-suggested match.
CAC is "the biggest, most important metric of all." Weekly view, Sunday–Saturday to match Meta.	Sun–Sat weeks hard-coded everywhere; CAC on the home screen; manual weekly spend entry bridges until the Meta key arrives.
Three automated emails. Daily to-dos (Miranda + Jake), Monday weekly report, monthly on the 1st.	Requires 24/7 hosting → Vercel + Supabase. Nightly analysis job computes Day-1/Day-3 buckets: applied-no-booking, consult no-shows, roadmap no-shows.
Ads "later" — but Meta key coming Thursday; second pipeline (low-ticket funnel) someday.	All integrations built now (Mitch's call): Meta + Google = the spend side, Stripe = the revenue side, GHL = the funnel between. Multi-pipeline in the schema from day one.
Sentry + Claude self-healing — promised on the call.	Sentry watches errors AND silences (a sync that returns zero leads). Drift triggers a Claude analysis proposing a remap — applied with one-click human approval, never blindly.

ONE CORRECTION, BEFORE JAKE ASKS

Stripe does not report ad spend — spend comes from the Meta and Google APIs. Stripe is the **revenue** side: real cash collected, payment plans, failed payments, refunds. That's what lets CAC be computed against actual money rather than hand-entered opportunity values. All three together are the complete picture.

The system

Why bugs stay out

- **One-way flow** — no writes to any external system, ever.
- **Pure metrics engine** — dashboard and emails call the *same* tested functions; they can never disagree.
- **Idempotent syncs** — re-running any import is always safe.
- **Unit-tested math** — CAC/funnel formulas verified against hand-computed fixtures in CI.

Key data design

- **Transition history** — every stage move timestamped by diffing syncs → answers "how long between steps".
- **Identity by email/phone** — joins ad click → GHL contact → Stripe payment across 30–90-day cycles (the Hyros pattern).
- **Provenance on every row** — source, sync time, backfilled flag.
- **Multi-pipeline native** — the low-ticket funnel drops in later with zero rework.

The screens

Navigation: Command Center · Funnel · Ads · Revenue · Reports · Setup. One date picker per page (presets include This/Last week Sun–Sat with resolved dates shown); a comparison dropdown (vs previous period / vs last year); delta chips on every number with exact dates on hover; plain-English labels ("Cost per client").

Command Center — the 10-second rule

Five pinned KPIs: **Revenue collected** · **Enrollments** · **Cost per client** · **ROAS** · **Consults booked** — each with delta chip and sparkline. Then the funnel, full width. Then a trend chart with faded comparison overlay beside an AI-insight card (max 3 specific findings, hidden when empty). Modeled on Triple Whale's Summary + Stripe's Home, per the design research.

The funnel — proportional bars, not a tapered cone

Solid bar = who's there; ghost = who dropped since the last stage; the % chips between rows are colored against the trailing 8-week average so a slipping step turns amber before it becomes a problem. Clicking any bar opens the actual list of people — at Jake's volumes, 12 no-shows are 12 names Miranda can call. (Amplitude/PostHog's rendering pattern; tapered funnels distort perception and no serious analytics tool uses them.)

Other tabs

TAB	CENTERPIECE
Funnel	Full funnel + conversion-over-time mini-charts per transition + per-source breakdown table + click-through people drawer.
Ads	Hyros-style campaign table: campaign rows × funnel-stage counts × cost-per-stage × deltas, plus FitFlow-tracked vs Meta-reported columns. Manual spend entry lives here until Thursday.
Revenue	Cash collected, recurring, failed payments (pinned), refunds; each enrollment payment tied to its source cohort.
Reports	Archive of every sent email digest + digest settings. Scorecard rules: one timeframe per digest; skip sending when empty.
Setup	Credential cards for GHL / Meta / Google / Stripe / Anthropic (verify-on-save, masked) + stage-role mapping + sync-health panel.

Build order — Thursday demo = A + B

A • Foundation shift

no keys needed

Supabase migration, read-only GHL, dynamic stage model, hourly sync with transition history, June-16 backfill, Vercel deploy. The marking UI comes out.

B • Jake's core asks

the transcript, delivered

Date/comparison engine (Sun–Sat weeks), tested metrics engine, Command Center + Funnel tab, manual spend entry feeding CAC, daily to-do email + Monday weekly report (monthly = same template on a monthly cron).

C • Money rails

keys arrive Thursday

Meta spend sync, Stripe payments + matching, Ads + Revenue tabs, CAC flips from manual to real spend, ROAS against real cash.

D • Intelligence

the promise kept

Anthropic insight cards + weekly narrative in the Monday email, Sentry + sync-health + Claude remap suggester, Google Ads OAuth (CSV fallback until granted), Reports archive.

What we're deliberately NOT building

ML multi-touch attribution and media-mix modeling (unverifiable theater at 2 channels — Northbeam charges \$1k+/mo and says it needs \$10M+ revenue), white-label/multi-tenant anything, a drag-and-drop dashboard builder, autonomous AI that acts on ads, creative analytics (Motion already does it), and CAPI conversion feedback (Jake is wiring that natively in GHL). Focus buys correctness.

Credentials checklist

KEY	WHEN	NOTES
GHL Private Integration Token	Thursday	Read-only scopes suffice now
Meta long-lived token + ad account ID	Thursday	Jake said he'd sort this at the 9am meeting
Stripe restricted key (read-only)	When ready	Charges + customers read scope only
Anthropic API key	When ready	Powers insights, narrative, self-heal
Resend key + verified domain	Before emails go live	The three emails send from this
Google Ads dev token + OAuth	Later	CSV upload covers Google spend until then

Plan for sign-off — nothing new is built yet. On approval, Phase A starts immediately; A + B are the Thursday demo. Design decisions are grounded in a competitive study of Triple Whale, Hyros, Northbeam, Wicked Reports, Databox, AgencyAnalytics, Polar Analytics, Stripe, Amplitude and PostHog.
